A method, system and program for selectively applying translucent filters to graphical images according to visual disability needs are provided. An image is received at a receiver communicatively connected via a network to an image server and connected to a display device for output of the image. A translucent style is specified for a particular user at the receiver. A translucent filter overlay is applied over the image according to the translucent style for output to the display device, such that the image output to the display device is adjusted to specifically accommodate for a visual disability of the particular user.
